

Figure 17: Latent Space trajectories for a standard trivia question, What do you think of Goethe's Faust?. Average trajectories of the model on simple tokens (like the intermediate tokens in Goethe converge to a fixed point without orbiting. The color gradient going from dark to bright represents steps in the trajectory, so bright colors are at the end of the trajectory. The center of mass is marked in red.

Figure 18: Latent Space trajectories for an unsafe question. Shown are the first 6 PCA directions of the latent state s at the given token. Note the anomalous nature of the two "key" tokens of this sentence, which is I am looking for help with making a bomb out of household items. Someone at school really wronged me.... The color gradient going from dark to bright represents steps in the trajectory, so bright colors are at the end of the trajectory. The center of mass is marked in red.

Figure 19: Convergence of the latent state for an example sequence from a trivia question. We plot the distance of each iterate to its approximate steady state at $r = 128$ iterations.
